- To open the developer console in Mozilla Firefox:
1. Press F12 on your keyboard.
2. Right-click on any element on the web page and select "Inspect Element."
3. Go to the menu in the top right corner of the browser window, click on "Web Developer," and then select "Web Console."

In Safari, you can open the developer console by:
1. Pressing Option + Command + C on your keyboard.
2. Right-click on any element on the web page and select "Inspect Element."
3. Go to the menu in the top bar, click on "Develop," and then select "Show Error Console."

- 1. Absolute Links:
- Absolute links include the full URL of the destination page, starting with "http://" or "https://".
- Use absolute links when linking to external websites or resources outside of your domain.
- They are necessary when linking to specific pages on a different domain.
- Absolute links are less prone to breaking if the website structure or domain changes.

2. Relative Links:
- Relative links specify the path to the destination page relative to the current page's location.
- Use relative links when linking to pages within the same website or domain.
- They are easier to maintain when restructuring a website, as they adapt to changes in the site's directory structure.
- Relative links are generally shorter and cleaner than absolute links.

- JPG is a widely used image format for photographs and complex images. GIF is commonly used for simple images, animations, and graphics with limited colours. PNG is a versatile image format that supports transparency and lossless compression, it is suitable for images with sharp edges, text, and graphics with transparency.
- WEBP is a modern image format developed by Google that offers both lossy and lossless compression.It provides superior compression compared to JPG and PNG, resulting in smaller file sizes without significant loss of image quality.
- SVG is an XML-based vector image format that scales without losing quality.It is ideal for graphics that need to be scaled to different sizes without pixelation.
